Course: Business Intelligence and Data Warehousing

There are four phases of implementation in the Project.

They are:

Phase 1: Business Analysis

Phase 2: Data Modeling

Phase 3: ETL Implementation

Phase 4: Tableau Implementation

Restaurant/Cafeteria Management system

Phase 1: Business Analysis

In this phase, we identified the business needs and provided solutions to business problems. The solutions consist of process improvement, strategic planning to incur profits and growth of the organization.

The Business Scenario includes the details of restaurant management, the process and operation flow of the restaurant, swim lane diagram, lead measures, lag measures and Analytical use cases (Descriptive and Predictive Analytics).

Domain: Food Service Industry

A restaurant management system is a POS (Point of Sale) transaction designed for the foodservice industry. Like a standard POS system, the restaurant management system helps capture transactions and manage inventory with accuracy and generally run daily processes more efficiently. A setup may include both software and hardware, such as the cash register, barcode scanner, and receipt printer.

Business Questions/Problems:

As a restaurant owner, how to ensure profitability as well as highest rating on social media for the restaurant

- How do I track daily revenue and what is driving more business to restaurant?
- How do I ensure customers love food
- How do I know which are most popular items?

The following are the multiple business processes/scenarios involved in restaurant management.

Customer Order creation:

A customer enters the restaurant and gets greeted by the receptionist of the restaurant. The receptionist checks for the customer reservation and assigns a table to the customer. The waiter of that table presents the Menu which contains details of food available in that restaurant. A customer browses through the menu and looks at the various food options available in the restaurant along with the price for each item. He selects items from the menu and places the order to the waiter of the table. The customer has successfully placed the order.

(makes a payment for the order. The receipt contains the itemized bill for the order along with the prices for each item and the tax applied)

Customers can also choose to order through self-order Kiosk. Categorized Menu with prices are visible and enabled with selection choices, as soon as the customer chooses items, the order is created in the database and is visible to the customer. The same order receipt is printed simultaneously in the kitchen as well for kitchen staff to prepare the order

Order queue and delivery: Kitchen Staff or Chefs get the current queue of orders, accept the orders and updates the order status to be ready once the order is prepared. Waiters pick up the orders that are ready and serve the customer. The customers can provide feedback for the service and the food.

Menu Management: Supervisors modify the menu items, add new items, delete items, and update descriptions on the menu board that appear to the customer.

Inventory Management:

The manager or supervisor tracks the current inventory stock. He checks the inventory items, makes a list of items and prepares a forecast of the required items in the future.

Reporting/Tracking the Revenue:

Restaurant manager prepares the sales revenue on a weekly, monthly, quarterly and annual basis. He also reports on the most popular items ordered by the customers, the average bill and the least popular items for further actions in menu management.

Scenario details/ Parsing Scenario to Identify key Information:

Stakeholders: Consumers/customers, Owner, Shareholder, Managers, Staff/Employees, Suppliers,

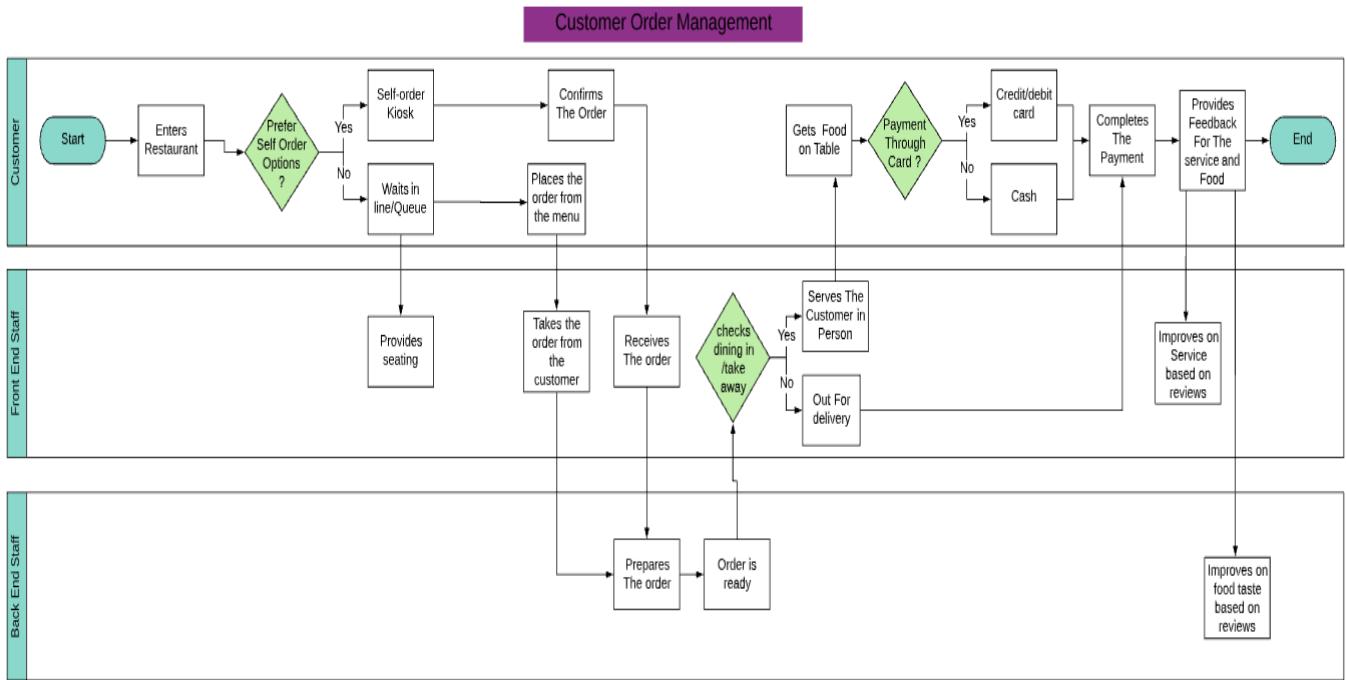

Products: Supply Stock, Inventory,

Infrastructure: Self-Order Kiosk, Computer, Receipt Printer, Furniture, Kitchen equipment.

Interpreting the Tasks and the Goals:

	Customer	Front-end staff (Manager/Supervisor/Waiter)	Back-end staff (Chef/sous-chef/cleaning team)
Tasks	Enter the restaurant. Order food. Wait for the food to be prepared. Eat the food/asks for take away. Pays the restaurant and leaves.	Welcome the customer. Help them find a table. Hand them the menu card. Take orders from customers. Acts as the Restaurant expeditor to maintain the efficient food delivery to customers by communicating to the back-end staff. Gets feedback from the customer while collecting the payment.	Takes customer orders from the front-end staff. Cooks the food. Hand the ready to go food to the front-end staff. Waits for customer feedback to improve on the food.
Goals	Eat/Buy food	Help customers from their entry to exit.	Cook and clean the restaurant.

Swim Lane Diagrams:

Description of the swim lane Diagram

The customer enters the restaurant and decides if he wants to self-order or be seated in the restaurant. The front-end staff here are referred to as waiters, receptionists, floor managers, etc. If the customer decides to do a takeaway, he can place his order through the Self-Order Kiosk which asks for confirmation of the order. Once the customer confirms the order, it goes to the kitchen where the chef prepares the order. When the order is ready the chef informs the waiters and they give to the customer. The customer then pays for the food through cash or card and provides feedback for the restaurant.

On the other hand, if the customer decides to eat at the restaurant the waiter will take them to the table and get them seated comfortably. Waiter then gives the menu the customer and gives them some time to order. The customer places the order and confirms it. The waiter then passes on the order to the chef who prepares it. When the order is ready the chef informs the waiters and they get it to the customer. After the customer is done eating, they pay for the food through cash or card and provides feedback for the restaurant.

Lead measures:

1. Increase average number of customers per day:

- New customers
- Regular customers

2. Offers and Discounts:

- Create new combos
- Discounts.

3. Marketing and advertising

4. Adding new food items to their menus.

5. Improve customer service and food taste.

6. Improve the ambience of the restaurant.

Lag Measures:

1) Average orders per day.

2) The mean table occupancy.

3) The money spent per head on average in the last 3 months.

4) Sales per employee per hour.

5) Present table turn rate.

6) Revenue generated per category per day.

7) Number of units sold per category of the menu.

8) ROI, Revenue growth.

GENERAL ANALYTICAL USE CASES:

Most ordered/raved about food item: The most ordered items with best reviews in the restaurant of the week, month and year.

Revenue generated and the performance of the restaurant: The revenue generated for the year, the best season of business, number of customers walk-ins comparing weekdays to weekends.

Most ordered food category: The most popular/profitable food categories in the restaurant like drinks, entrees or special combo options which will help the restaurant build better menus in the future.

Descriptive Analytical Use cases:

1. Food and service ratings per year.
2. Customer's Age distribution
3. Revenue generated based on Gender per quarter.
4. Customer's locations.
5. Revenue generated by Top 10 customers.

Predictive Analytical Use cases:

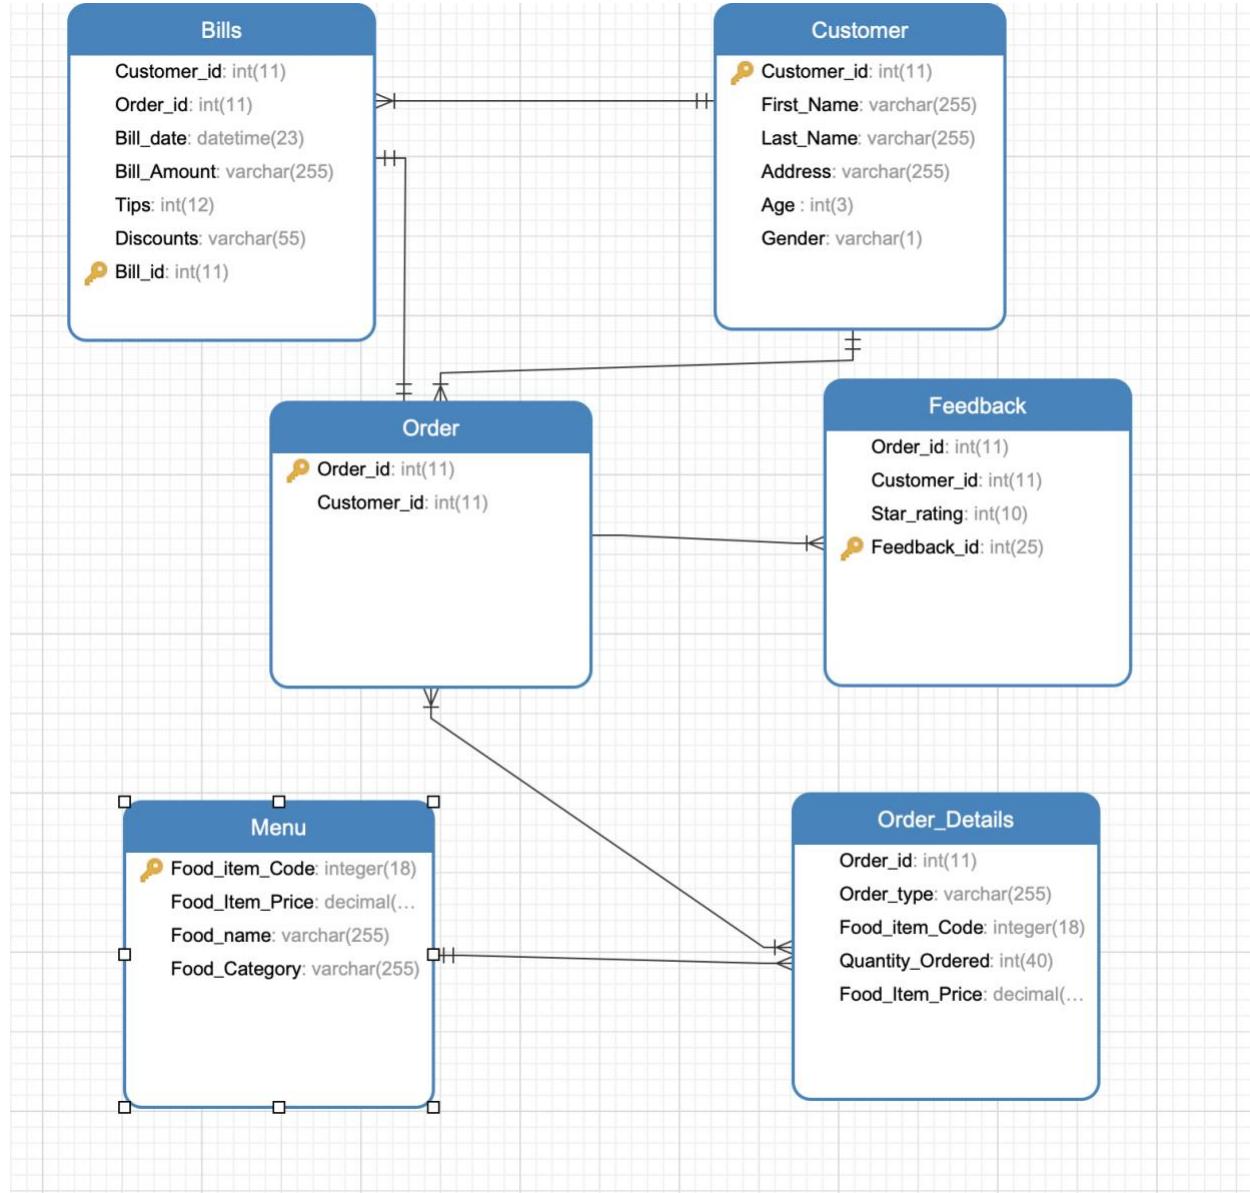

1. How will discount, offers work on the restaurant business?
2. Improving Loyalty membership programs.
3. By Adding new food items to their menus, how will the sales impact?
4. Attracting customers by introducing Marketing and Advertising strategies.
5. The number of times an extra ingredient or food item was requested.
6. Table turnover rate

Phase 2: Data Modeling

OLTP Schema Design:

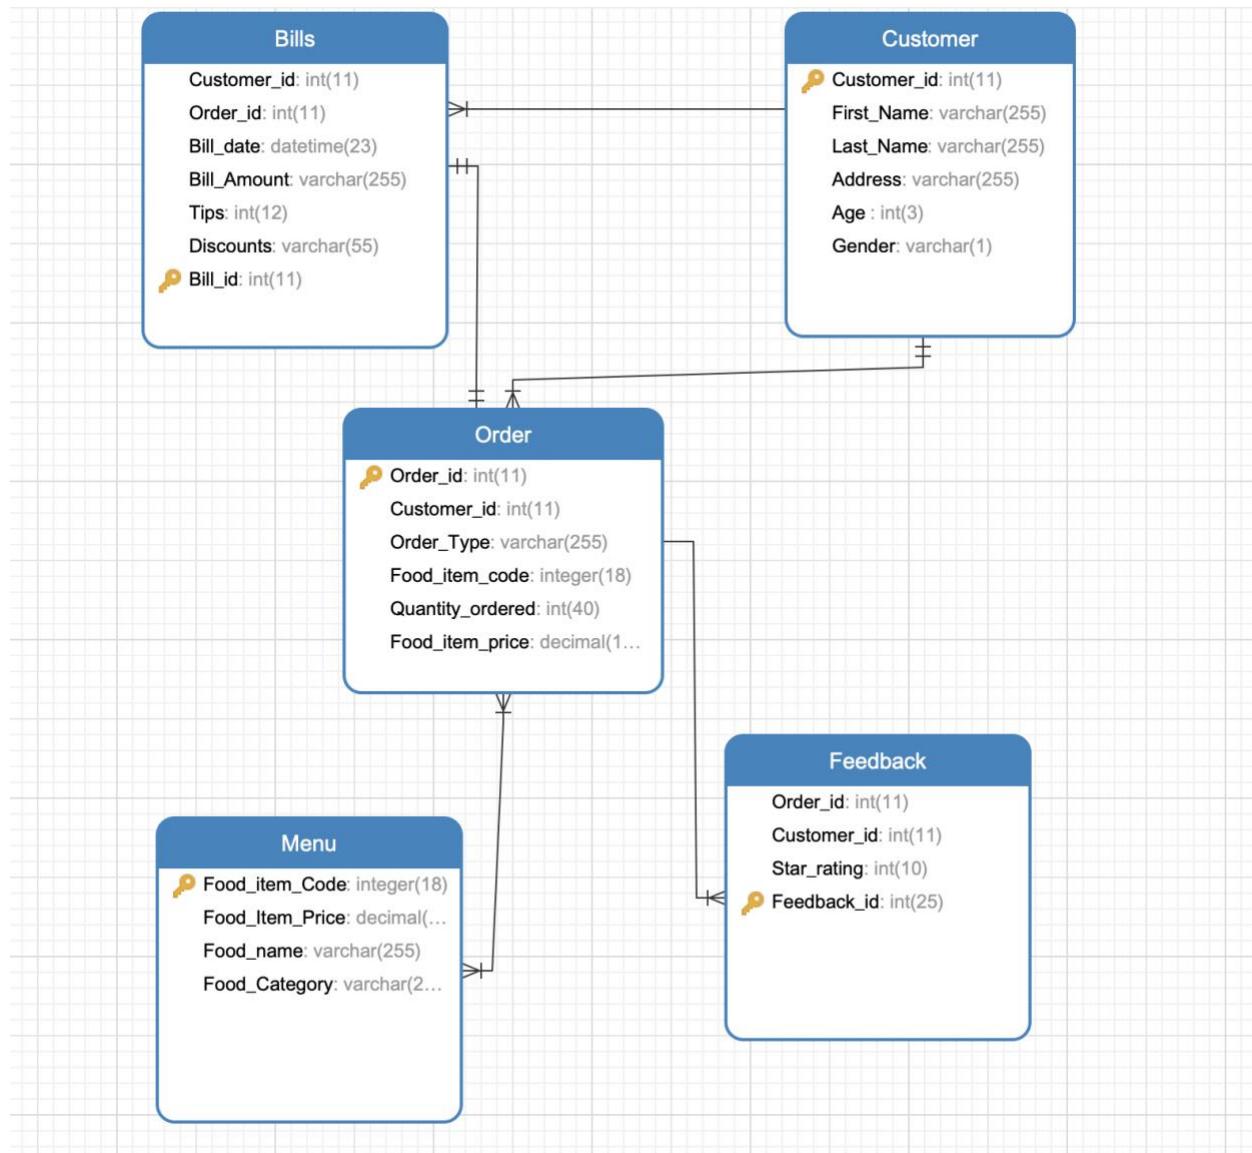

The OLTP schema is designed to have 6 tables Bills, Order, Menu, Customer, Feedback and Order Details. In this design, order details are an associative entity.

Screenshot of OLTP Data Model (Navicat):

ODS Schema: In ODS Schema, there are 5 tables Customer, Orders, Menu, Bills and Feedback. Order and Order Details from OLTP schema is merged into one table as a preparation to convert the OLTP schema into OLAP schema.

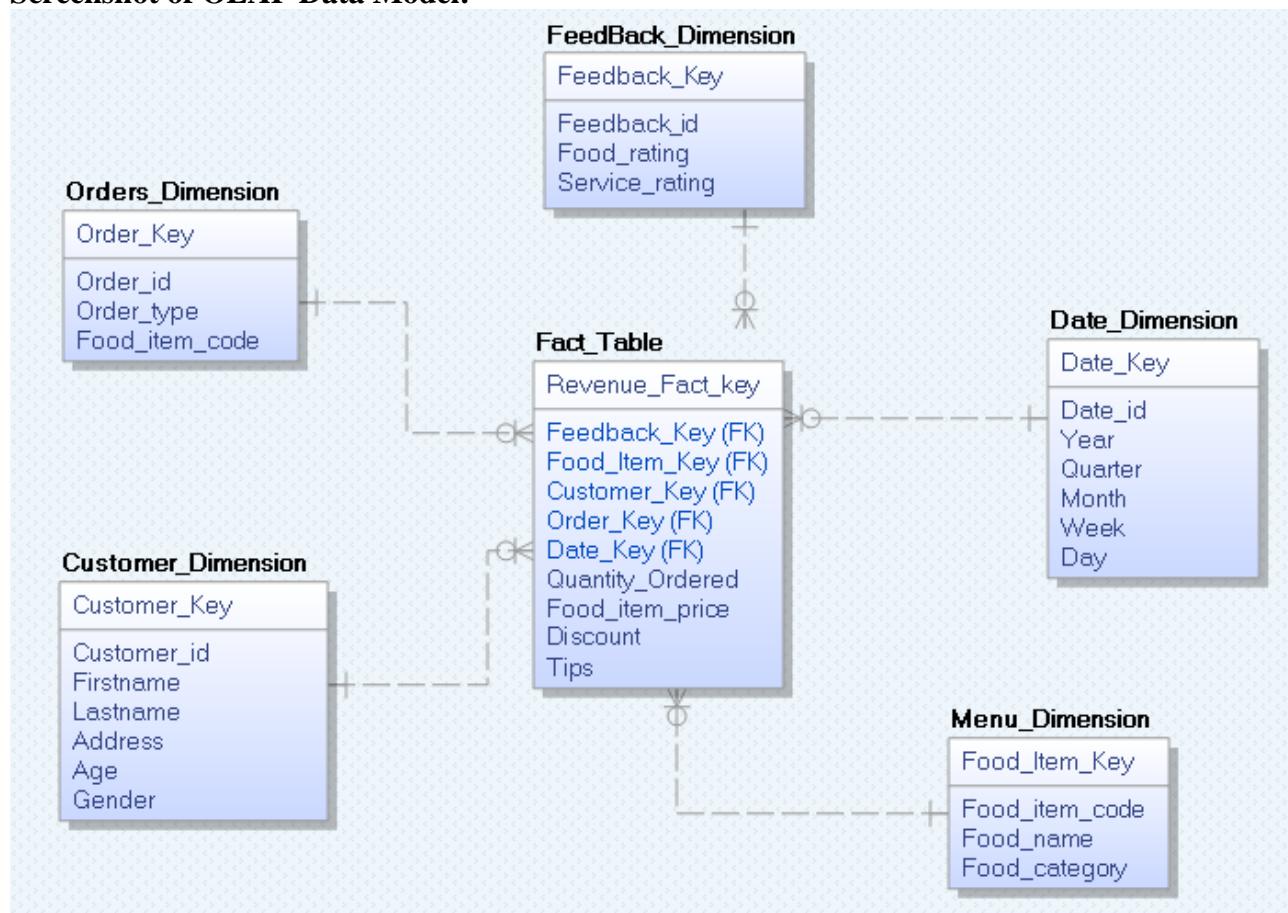

Screenshot of ODS Data Model:

Data Warehouse Schema (Facts & Dimensions): Designed the OLAP schema for the restaurant management in ERWIN. There are five Dimension tables and one fact table. The Dimension tables are:

1. Customer
2. Orders
3. Menu
4. Date
5. Feedback

Screenshot of OLAP Data Model:

Phase 3: ETL Implementation

Data Sources used for implementation:

1. MySQL Database
2. Json
3. CSV
4. Excel

Data Sets: Few of the tables data are manually generated from generatedata.com

Website: [Generatedata.com](http://generatedata.com)

Order of generating Data in Tables:

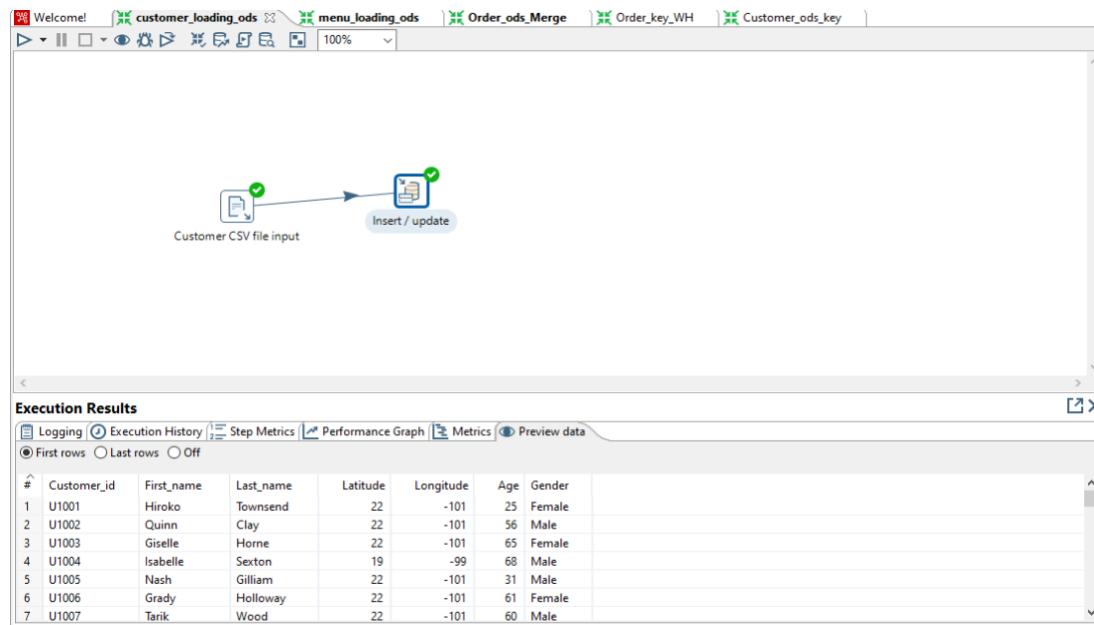

1. Menu table
2. Customer Table
3. Orders Table
4. Order details table
5. Feedback Table
6. Payments or Bills

SQL Dump: Project_OLTP Schema is exported using Forward Engineering.

Part 1: Extracting data from different data sources:

File 1: Load data into customer_ods from customer csv file.

ETL Transformation:

MySQL Results:

The customer_ods table is as shown below:

The screenshot shows the MySQL Workbench interface with the SQL tab selected. The query window contains the following code:

```
1 select * from orangebee_ods.customer_ods;
2
3 • select * from orangebee_ods.menu_ods where calories is null;
4
5 • select * from orangebee_ods.order_ods;
```

The results grid displays the following data for the customer_ods table:

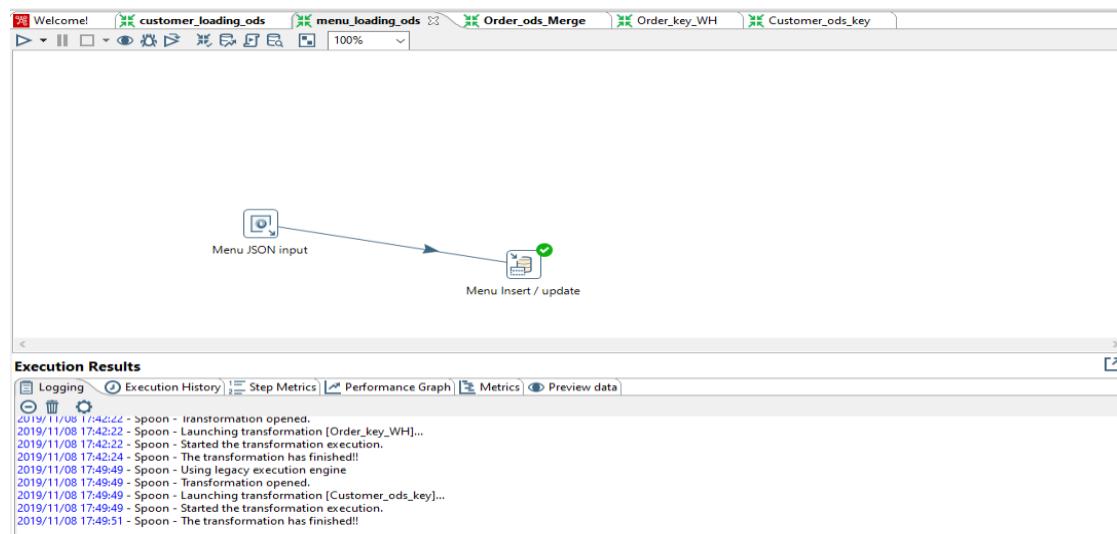

Customer_id	First_name	Last_name	Latitude	Longitude	Age	Gender	last_wh_update
U1001	Hiroko	Townsend	22	-101	25	Female	2019-11-08 00:00:00
U1002	Quinn	Clay	22	-101	56	Male	2019-11-08 00:00:00
U1003	Giselle	Horne	22	-101	65	Female	2019-11-08 00:00:00
U1004	Isabelle	Sexton	19	-99	68	Male	2019-11-08 00:00:00
U1005	Nash	Gilliam	22	-101	31	Male	2019-11-08 00:00:00
U1006	Grady	Holloway	22	-101	61	Female	2019-11-08 00:00:00
U1007	Tarik	Wood	22	-101	60	Male	2019-11-08 00:00:00
U1008	Port	Johansen	22	-101	21	Male	2019-11-08 00:00:00

The output pane shows the execution history:

#	Time	Action	Message
92	17:49:16	select * from orangebee_ods.order_ods LIMIT 0, 1000	622 row(s) returned
93	17:49:22	select * from orangebee_ods.order_ods LIMIT 0, 1000	622 row(s) returned
94	17:49:27	select * from orangebee_wh.dim_order LIMIT 0, 1000	622 row(s) returned
95	17:50:27	select * from orangebee_wh.dim_customer LIMIT 0, 1000	138 row(s) returned
96	17:50:35	select * from orangebee_ods.customer_ods LIMIT 0, 1000	138 row(s) returned
97	18:03:39	select * from orangebee_ods.customer_ods LIMIT 0, 1000	138 row(s) returned

File 2: Load data into menu_ods from a json Menu File

ETL Transformation:

MySQL Results:

The screenshot shows the MySQL Workbench interface. At the top, there are tabs for Class assignment*, SQL File 3*, SQL File 4*, OLTP Assignment, SQL File 8*, and SQL File 7*. Below the tabs, a query editor window displays the following SQL code:

```
1 select * from orangebee_ods.customer_ods;
2
3 • * from orangebee_ods.menu_ods
4
5 select * from orangebee_ods.order_ods;
```

The results grid shows data from the menu_ods table:

Food_Item_code	Food_Item_name	Food_Category	Calories	Price
10012	French Onion Soup	Soup	370	3.69
10013	Tomato Basil Soup	Soup	190	3.69
10014	Chili	Soup	320	3.69
10018	Chicken Tortilla Soup	Soup	200	3.69
60007	Strawberry Shake	Beverages	730	6
10020	House Salad	Salads	190	3.69
10023	Oriental Chicken Salad	Salads	460	5

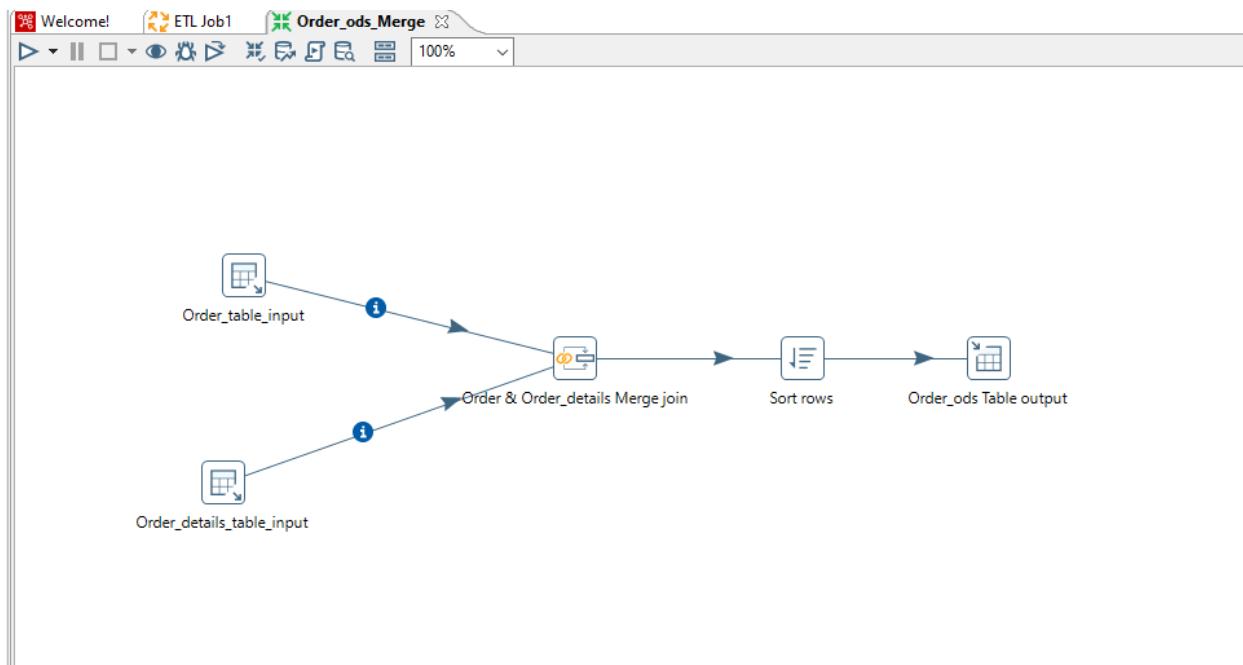

On the right side of the interface, a message box states: "Automatic context help is disabled. Use the toolbar to manually get help for the current caret position or to toggle automatic help."

Below the results grid, an "Output" section shows the execution history:

#	Time	Action	Message	Duration / Fetch
94	17:49:27	select * from orangebee_wh.dim_order LIMIT 0, 1000	622 row(s) returned	0.000 sec / 0.000 sec
95	17:50:27	select * from orangebee_wh.dim_customer LIMIT 0, 1000	138 row(s) returned	0.000 sec / 0.000 sec
96	17:50:35	select * from orangebee_ods.customer_ods LIMIT 0, 1000	138 row(s) returned	0.015 sec / 0.000 sec
97	18:03:39	select * from orangebee_ods.customer_ods LIMIT 0, 1000	138 row(s) returned	0.000 sec / 0.000 sec

File 3: Load data into orders_ods by joining/merging from Orders and order_details from database

ETL Transformation:

MySQL Results:

Price	double

Query Completed

File 2: Loading Menu from ODS to Menu Warehouse

KTR File:

MySQL result:

The screenshot shows the MySQL Workbench interface. On the left, the Schemas tree is visible, showing databases like Local instance, Lab1_MYSQL, wh_analysis, BI_wh_SQL_schema_queries, OLTP_Mytreyi_Rddy, and Project*. The main area displays a query results grid for a SELECT statement on the dim_menu table. The grid has columns: food_item_key, Food_Item_Code, Food_Item_Name, Food_Category, Calories, Price, and Discount. The results show various menu items like Chili, Chicken Tortilla Soup, Strawberry Shake, and House Salad. To the right of the grid is a sidebar with a vertical list of SHOW SQL commands, each preceded by a star icon.

File 3: Loading date excel file to dimension date table

KTR:

The screenshot shows the Pentaho Data Integration (KTR) interface. On the left, a navigation tree lists various transformation types: Input, Output, Streaming, Transform, Utility, Flow, Scripting, Pentaho Server, Lookup, Joins, Data Warehouse, Validation, Statistics, Big Data, Agile, Cryptography, Job, Mapping, Bulk loading, Inline, Experimental, Deprecated, and History. The main workspace displays a transformation flow: Microsoft Excel input -> Insert / update -> Dim Table output. Below the flow is an 'Execution Results' panel showing the log of the transformation process, including logs, execution history, step metrics, performance graph, metrics, and preview data. The log entries indicate the transformation was opened, launched, started, and completed successfully.

MySQL Results:

```

18 • select * from Orangebee_wh.dim_menu; -- 259 records
19 • select * from Orangebee_wh.dim_customer; -- 500 records
20 • select * from Orangebee_wh.dim_order; -- 3314 records
21 • select * from Orangebee_wh.dim_feedback; -- 2999 records
22 • select * from Orangebee_wh.dim_date; --
23
24 • select * from Orangebee_wh.revenue_fact;

MySQL Workbench

The screenshot shows the MySQL Workbench interface. On the left, the 'Schemas' tree view is expanded to show the 'Orangebee_wh' schema, which contains tables like 'dim_customer', 'dim_date', etc. The central area displays a query results grid for a 'revenue_fact' table with 89 rows. The right side features a vertical toolbar with various SQL SHOW commands. Below the grid, a 'History' pane lists the execution of several SQL statements, including SELECTs and a DROP TABLE command.

```

27 • select * from Orangebee_wh.dim_order; -- 3314 records
28 • select * from Orangebee_wh.dim_feedback; -- 2999 records
29 • select * from Orangebee_wh.dim_date; -- 699 records
30
31 • select * from Orangebee_wh.revenue_fact;

File 5: Job Transformation: ETL Job with all KTRs in sequence of execution:

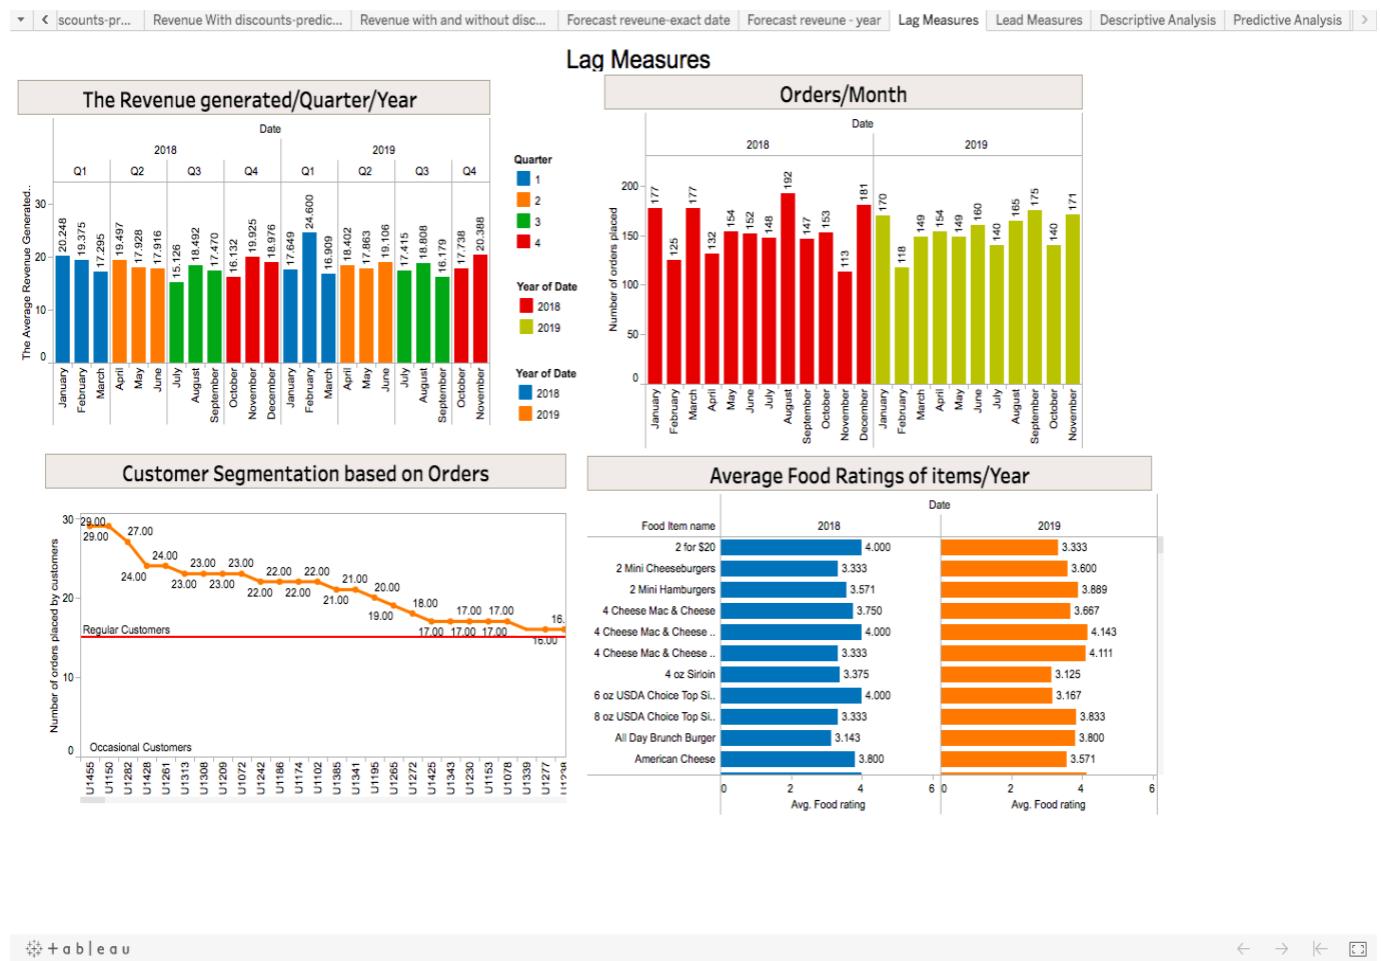

Phase 4: Tableau Implementation

The Tableau file, twbx has various lead and lag measures. The main metrics which are highly important and impact the business are taken and included in dashboards.

Dashboard 1 - Lag Measures:

1. Finding revenue generated for a quarter/ year.
2. Average orders per month.
3. Customers differentiation based on their number of orders - regular customers and occasional customers.
4. Average of food ratings per year.

Dashboard 2 - Lead Measures:

1. A number of unique customers per week/month.
2. The most popular food item and food category - per quarter
3. Highest revenue generated for food item per quarter - the food item that brought the most revenue

« < | Discounts-pr... | Revenue With discounts-predic... | Revenue with and without disc... | Forecast revenue-exact date | Forecast revenue - year | Lag Measures | Lead Measures | Descriptive Analysis | Predictive Analysis | > »

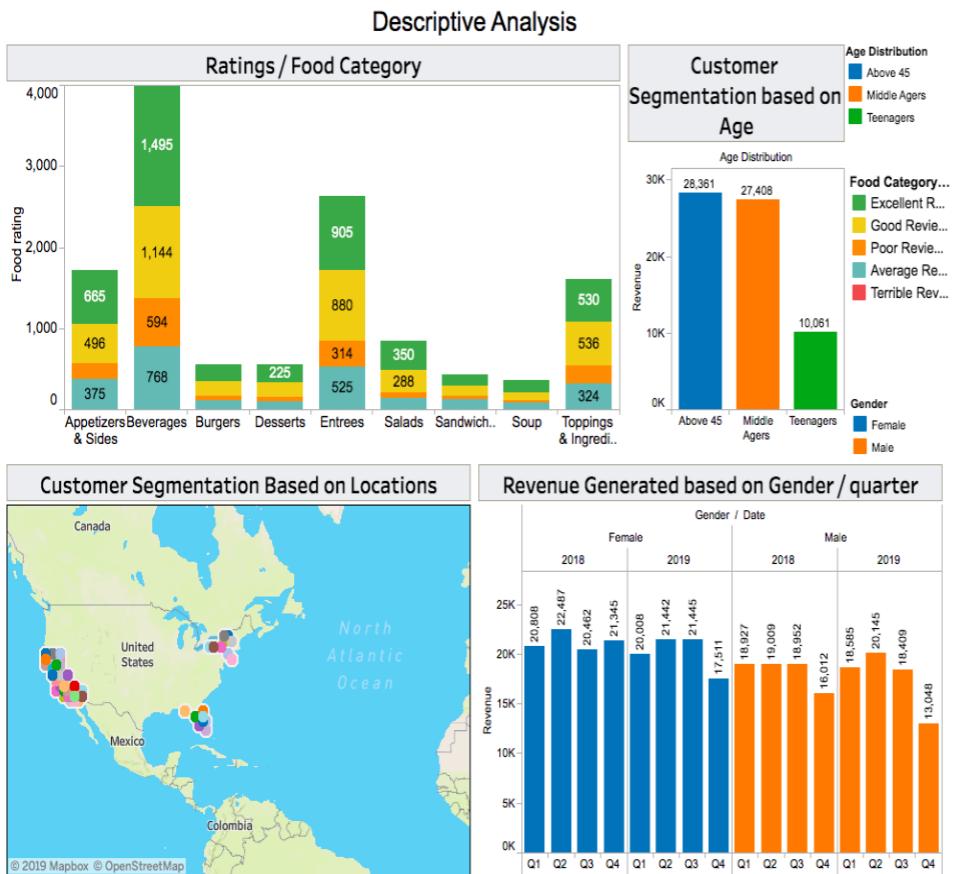

ctrl + a b | e a u

← → ↵ []

Dashboard 3 – Descriptive Analytics:

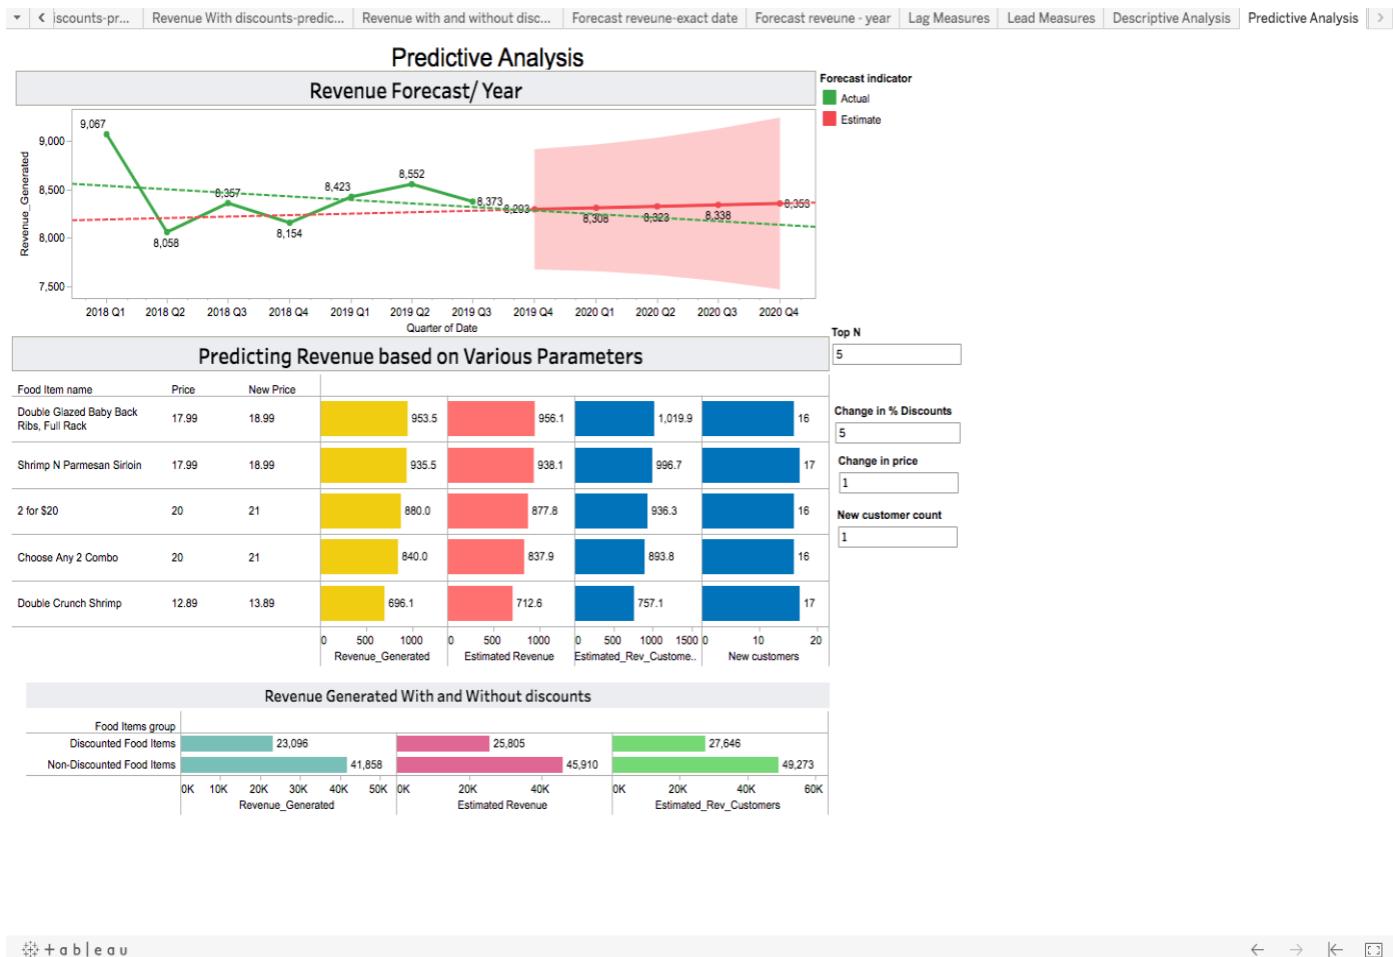

1. Food and service ratings through 2018-2019
2. Customer's Age distribution
3. Revenue generated based on Gender per quarter.
4. Customer's locations.

↳ Discounts-pr... | Revenue With discounts-predic... | Revenue with and without disc... | Forecast revenue-exact date | Forecast revenue - year | Lag Measures | Lead Measures | Descriptive Analysis | Predictive Analysis | >

Dashboard 4 - Predictive:

1. Revenue Forecast For next 4 quarters.
2. Predicting revenue based on variations in discounts, price and customer base.
3. Total Revenue that is generated With and Without discounts.

Link to The Tableau Public Server:

https://public.tableau.com/profile/mytreyi.reddy#!/vizhome/Project_Final_OrangeBee/LagMeasures

Future Enhancements: For precise prediction, Including Parameters such as Quantity Ordered, most preferred food items, specific highest revenue generated orders give accurate growth and profits.

Conclusion:

By analyzing all these metrics and reports business can know the frequency of special requests to engineer the menu and could know why a certain day of the week attracts fewer customers? Therefore, analyzing every datapoint related to the restaurant business and converting them into meaningful insights can help improve everything from menus and staff straining to restaurant policies and marketing campaigns.
